[WordPress Plugin Directory] Review in Progress: Headless Portfolio CMS

WordPress.org Plugin Directory <plugins@wordpress.org> 16 May 2026 at 14:29
To: Al Adil Ashrafi Saikat <aladilashrafisaikat@gmail.com>

It's time to move forward with the plugin review "anytv"!

Your plugin is not yet ready to be approved, you are receiving this email because the volunteers have manually checked it and have found some issues in the code / functionality of your plugin.

Please **check this email thoroughly**, address any issues listed, test your changes, and upload a corrected version of your code if all is well.

List of issues found

Use wp_enqueue commands

Your plugin is not correctly including JS and/or CSS. You should be using the built in functions for this:

When including **JavaScript code** you can use:

- wp_register_script() and wp_enqueue_script() to add JavaScript code from a file.
- wp_add_inline_script() to add inline JavaScript code to previous declared scripts.

When including **CSS** you can use:

- wp_register_style() and wp_enqueue_style() to add CSS from a file.
- wp_add_inline_style() to add inline CSS to previously declared CSS.

Note that as of WordPress 6.3, you can easily pass attributes like defer or async: https://make.wordpress.org/core/2023/07/14/registering-scripts-with-async-and-defer-attributes-in-wordpress-6-3/

Also, as of WordPress 5.7, you can pass other attributes by using this functions and filters: https://make.wordpress.org/core/2021/02/23/introducing-script-attributes-related-functions-in-wordpress-5-7/

If you're trying to enqueue on the admin pages you'll want to use the admin enqueues.

- https://developer.wordpress.org/reference/hooks/admin_enqueue_scripts/
- https://developer.wordpress.org/reference/hooks/admin_print_scripts/
- https://developer.wordpress.org/reference/hooks/admin_print_styles/

Example(s) from your plugin:

```
includes/Admin/Uninstaller.php:62 <style>
```

Check `permission_callback` in REST API Route

When using `register_rest_route()` or `wp_register_ability()` to define custom REST API endpoints, it is crucial to include a proper `permission_callback`.

🔒 This callback function ensures that only authorized users can access or modify data through your endpoint.

Code example, checking that the user can change options:

```
register_rest_route( 'headless-portfolio-cms/v1', '/my-endpoint', array(
    'methods' => 'GET',
    'callback' => 'headless-portfolio-cms_callback_function',
    'permission_callback' => function() {
        return current_user_can( 'manage_options' );
    }
) );
```

Please check the register_rest_route() documentation and the current_user_can() documentation.

✅ **When a `permission_callback` is NOT Required**:

There are valid use cases for public endpoints, such as publicly available data (e.g., posts, public metadata) or endpoints designed for unauthenticated access (e.g., fetching public stats or information).

In these cases, you should use `__return_true` as the `permission_callback` to indicate that the endpoint is intentionally public.

🔒 **When a `permission_callback` IS Required**:

For endpoints that involve sensitive data or actions (e.g., getting not public data, creating, updating, or deleting content).

In these cases, you should always implement proper permission checks.

Possible cases found on this plugin's code:

```
includes/API/Contact.php:8 register_rest_route($ns, '/contact', ['methods' => 'POST', 'callback' => [__CLASS__,
'handle_submission'], 'permission_callback' => [Registry::class, 'check_public_read_permission']]);
# ✨ POST endpoint creates contact log entries and stores submitted data, but the permission callback resolves to a
method that always returns true with no real authorization or equivalent secure verification.
```

👉 Continue with the review process.

Read this email thoroughly.

Take the time to thoroughly review and understand the issues identified. Examine the provided examples, consult the relevant documentation, and conduct any additional research necessary. The goal of our review process is to help you clearly understand the reported issues so you can resolve them effectively and prevent similar problems in future updates to your plugin.
Note that there may be false positives - we are humans and make mistakes, we apologize if there is anything we have gotten wrong. If you have doubts you can ask us for clarification, when asking us please be clear, concise, direct and include an example.

📋 Complete your checklist.

✅ **I fixed all the issues** in my plugin based on the feedback I received and my own review, as I know that the Plugins Team may not share all cases of the same issue. **I am familiar with tools** such as Plugin Check, PHPCS + WPCS, and similar utilities to help me identify problems in my code.
✅ **I tested my updated plugin on a clean WordPress installation** with WP_DEBUG set to true.

> ⚠️ **Do not skip this step.** Testing is essential to make sure your fixes actually work and that you haven't introduced new issues.

✅ **I acknowledge that this review will be rejected** if I overlook the issues or fail to test my code.
✅ **I went to "Add your plugin" and uploaded the updated version**. *I can continue updating the code there throughout the review process — the team will always check the latest version.*
✅ I replied to **this** email. I was concise and shared any clarifications or important context that the team needed to know.
I didn't list all the changes, as the team will review the entire plugin again and that is not necessary at all.

ℹ️ To help speed up the review process, we kindly ask that you **carefully verify and address all reported issues before resubmitting your code**.

While we try to make our reviews as exhaustive as possible we, like you, are humans and may have missed things. We appreciate your patience and understanding.
